Tabulation size in the context of formatting or text display typically refers to the number of spaces or characters that represent a single level of indentation when using tabs. It's often customizable to suit coding styles or text layout preferences. For instance, in Java, a common convention is to use a tab size of 4 spaces for indentation. If you're referring to setting a specific tabulation size for your PDF content creation using PDFBox, it's important to note that PDFBox does not directly handle tabulation or indentation in the same way as a text editor might. However, you can simulate indentation by using spaces or adjusting the starting X coordinate when drawing text. If you want to simulate tabulation with spaces, you can simply multiply the desired tabulation size by the number of spaces you want to use for each tab level. Here's an example:
